

# Ape Minders: Trading Cryptocurrency on NFT Signals

Andreas Michael, Michael Wander,  
Daria Vasileva, Amit Kumar

# Overview

- Market universe and data sources
- Feature extraction and regression models
- Trading algorithm
- Backtesting and portfolio performance

# Introduction Main Strategy

- Trade in a universe of seven instruments - cryptocurrencies related to or directly used to purchase NFTs (mainly) on their respective blockchains
- Predict returns of these instruments using:
  - Technical factors of the instruments (rsi, bb, atr, macd, etc.)
  - Quantitative NFT data (sales, trades, volume, etc.)
  - Alternative NFT data (sentiment data analyzed from online posts)
- Trading strategy created using signals resulting from:
  - Technical indicators
  - Predicted returns
- Since these instruments are used to purchase NFTs, we hypothesize that NFT related data will work well as features for modeling their prices

# Market Universe

- Large-cap cryptocurrencies: **Solana** (SOL), **Cardano** (ADA), **Avalanche** (AVAX)
- Medium-cap cryptocurrencies: **Polygon** (MATIC), **Decentraland** (MANA), **Flow** (FLOW)
- Small-cap cryptocurrency: **Theta Fuel** (TFUEL)
- Date ranges of the ingested data are [2017-10-02, 2022-04-17], but backtesting, model training, and strategy evaluation is done on the range [2021-09-19, 2022-03-20]
- OHLCV data, as well as market cap data, is sourced from <https://coincodex.com/>

## AMI (Ape Minders Index)

- Treated as a benchmark using a buy and hold strategy
- Comprised of the 7 coins that we use as financial instruments for trading
- Is a weighted based on market capitalization-weighted index
- Rebalanced on quarterly basis

# Feature Data: Quantitative NFT

- features associated with various NFT markets and collections is sourced from <https://nonfungible.com/market-tracker>

ABOUT NONFUNGIBLE.COM

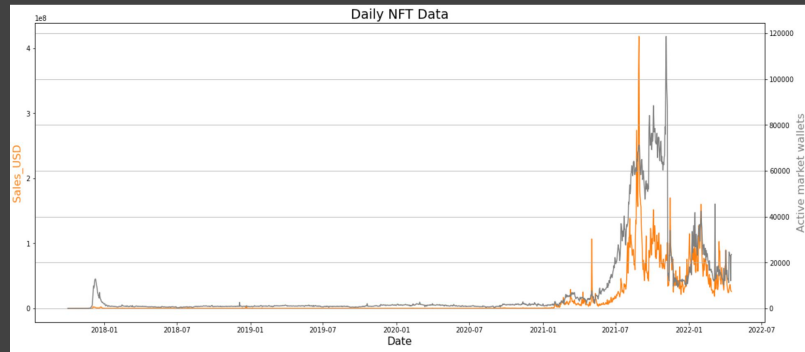

## Transparency and understanding in the NFT ecosystem

Established in 2018 initially to track real-time transactions of Decentraland, the company has since developed along with the space and is today one of the main pillars of the Non-Fungible Token ecosystem as the most trusted NFT Market data and analysis reference.

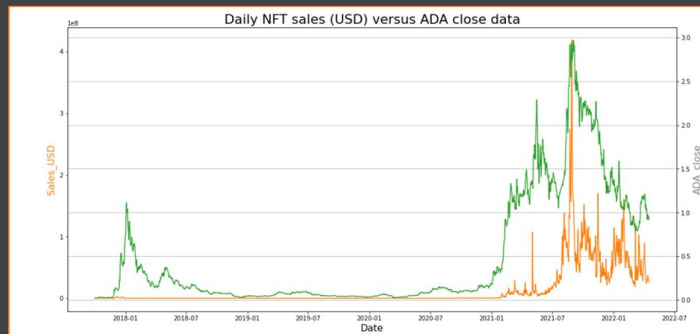

<https://nonfungible.com/about>

real-time on

Track decentralized asset transactions

1. Date
2. Number of sales
3. sales USD
4. Average USD
5. Active Market wallets
6. Primary sales USD
7. Secondary sales USD
8. Unique buyers
9. Unique sellers
10. Primary Sales
11. Secondary sales

# Feature Data: Alternative NFT Data

- Text data from the subreddit r/NFT, which was created in 2016, although the posts acquired from the API only date back to 2019-02-28
- Main posts, or “submissions” only, no comment / reply data analyzed
- Most posts have only a title and media, so we analyze both the title and the text of the post (if any) together
- PRAW and PSAW used to gather ~300k posts from r/NFT

	Title	Selftext
Date		
2019-02-28	A NonFungible Token Stampede Is Coming – Coinm...	NaN
2019-02-28	Decentraland Creator Contest - Building on NFT...	NaN
2019-02-28	NFTY News	NaN
2019-02-28	'No Wallet Needed': Mobile Cryptopunk Game	NaN
2019-07-06	Yat Siu - NFT is why content will be king again	NaN

# Feature Extraction: Alternative NFT Data

- Sentiment analysis on the titles and text of posts done using spaCy with the spacytextblob pipeline component
- There are many more posts from 2021-2022 than 2019-2020
- Two different aggregations (summed polarity and mean polarity) are done for each day
- Sentiment label (-1, 0, 1) threshold of  $-100 <$  or  $> 100$  polarity sum score
- Daily polarity is mostly positive, most likely since not many anti-NFT or bad news posts would be allowed by the moderation

# Regression Models for Returns

- With technical factor data and NFT related data, regression models are trained using one-day forward returns as the target variable
- Technical indicators of each instrument, as well as NFT quantitative and sentiment data are used to train the model
- Linear regression, random forest, and XGBoost evaluated

Linear Regression Coefficients

Random Forest Feature Importance

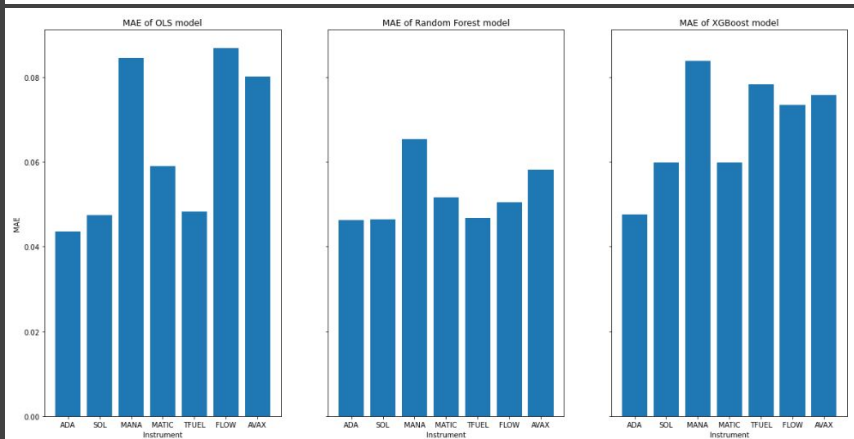

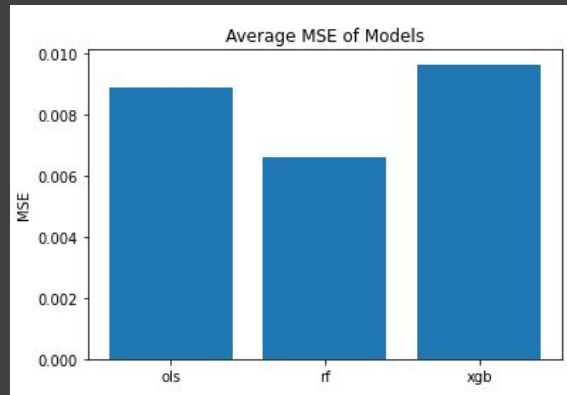

XGBRegressor Feature Importance

# Trading Algorithm

## Initialization parameters

- Initial portfolio value is 40k USD
- Maximum holding period is 18 days
- Commission percentage is 0.1%
- Spread of the slippage impact is set at 0.2%
- Stop loss variable is set at 2%
- Created equal weights of each coin to hold in our portfolio

## Strategy

- Create long signals for the top 2 coins each day whose predicted forward returns are more than 1%
- Create short signals for the top 2 coins each day whose predicted forward returns are less than 0%
- Stop loss on long; sell everything if the coin's price drops lower than the 2% of the first bollinger band

# Portfolio evaluation

The portfolio's value started from 40000 USD to 47523 USD  
By buying and holding the benchmark (AMI index), it starts from 40000 USD to 25504 USD

Start date = 2021-11-20  
End date= 2022-03-20  
In-sample months = 3  
Out-of-sample months = 3  
Live start date = 2022-01-01

In-sample alpha = 0.54  
Out-of-sample alpha = 0.52

# Additional plots for performance evaluation

- Risk-adjusted return metric
- Sharpe-ratios above 1 are considered to be good
- Good means offering excess returns relative to its volatility.

- Drawdown plot provides an overview of the worst drawdown periods in the backtest
- The plots coupled together, shows where algorithm struggles. The less volatile an algorithm is, the more minimal the drawdowns

- Use plot to gain an insight into whether the total portfolio holdings fluctuate from day to day
- This plot provides a good sanity check with regards to the trading behavior of our strategy

# Conclusion

- Our strategy is effective over our backtesting period, which is a difficult one to predict since it contains the all-time crypto highs
- It could perform differently in other periods
- Text sentiment from r/NFT didn't factor into random forest and XGBoost models, but did slightly in the OLS model
- NFT sales data was useful to all models
- All NFT data used was general and not chain-specific. The latter may increase accuracy / effectiveness
